EXPERIENCE

easybits GmbH

Solutions Architect & Founding Engineer

Jan 2025–Dec 2025, Berlin

Tech Stack: Qdrant, RabbitMQ, Kubernetes, Terraform, sentence-transformers, llama.cpp

- Founding engineer for MoBerries automation platform spin-off. Solo Python engineer responsible for backend services, ML integrations, and AWS infrastructure (EKS).
- Evolved prototype codebase into production system through systematic refactoring, establishing $\approx 98\%$ test coverage, CI/CD pipelines, and engineering best practices (RFC workflow, semantic versioning, release processes). Reduced deployment cycles from hours to minutes.
- Built internal intent classification through systematic iteration: keyword-based $\rightarrow$ fine-tuned xlm-RoBERTa $\rightarrow$ fine-tuned Qwen2-1.5B $\rightarrow$ currently OpenAI o1-mini for big scale production data collection. Final in-house model achieved 99% accuracy (0.99 F1 score) on zero-shot 5-class classification. Integrated self-hosted LLMs with cloud provider fallbacks for production automation workflows.
- Managed AWS EKS infrastructure with auto-scaling, monitoring, and self-hosted LLM deployments. Collaborated with CTO and offshore developer to bring platform from prototype to market-ready state within 12 months.

MoBerries GmbH

Solutions Architect & Lead Python Engineer

May 2022–Dec 2024, Berlin

Tech Stack: Django, PostgreSQL, Kubernetes, Terraform, AWS, PyTorch, Tensorflow (2.0)

- Owned all Python engineering and led 2-person team. Architected distributed AI automation platform from scratch, replacing 3 duplicate messaging codebases with Django-based orchestration layer and stateless Python microservices for message parsing, routing, and AI task execution. Platform processed 2M+ messages across APIs, WhatsApp, Telegram, and Meta Messenger, handling 650+ concurrent AI generation requests. Platform success led to easybits GmbH spin-off in 2025.
- Mentored DevOps engineer and BI analyst, reviewing their work and supporting infrastructure automation and data pipeline development.
- Built modular automation framework with reusable building blocks for AI-powered workflows. Implemented semantic search (Qdrant), document text extraction, multi-class text classification, and image generation using self-hosted models (llama.cpp) with cloud provider fallbacks. Extended platform capabilities through new automation modules as product requirements evolved.

SUMMARY

Backend & ML Engineer with 8+ years of experience building scalable Python systems and leading technical teams. Specialized in Django-based microservices, ML integration, and platform architecture. Architected AI automation platform that processed 2M+ messages and spun off into easybits GmbH. Strong track record progressing from working student to founding engineer, mentoring teams of 3-5 developers, and driving engineering practices from prototype to production.

SKILLS

Languages	Python, Bash, C/C++, JavaScript
Frameworks & ML	FastAPI, Django, Flask, PyTorch, Transformers, llama.cpp
Cloud & DevOps	LAMP, AWS, Docker, Kubernetes, Terraform, Terragrunt, Helm
Databases	MongoDB, Redis, SQLite, MySQL, PostgreSQL, Qdrant, ElasticSearch

Education

Berliner Hochschule für Technik

BSc. Mathematics

- **Thesis:** "Machine Learning Methods for Localization and Classification of Insects in Images" (part of the [KInsecta](#) research project).
- **Focus:** Applied Mathematics and Statistics.
- **Relevance:** Applied deep learning techniques for object detection for biological datasets on edge devices, bridging theoretical math with practical ML implementation.

MoBerries GmbH

Working Student Python Backend Engineering (20h/week)

Oct 2018–Apr 2022, Berlin

Tech Stack: Django, JavaScript, React, PostgreSQL, MongoDB, Elasticsearch, RabbitMQ, Docker, Kubernetes, Terraform, AWS

- Rapid progression from junior developer to technical lead over 3.5 years during company downsizing. Started in 3-person team maintaining internal backend; by 2020 became sole Python backend engineer supporting 10+ developers across teams with features, fixes, and infrastructure improvements.
- Established comprehensive test coverage in absence of QA team, implemented CI/CD improvements, and maintained production systems through multiple scaling phases. Led team of 2 developers (1 FT, 1 PT) starting 2021.
- Transitioned to ML/matching focus (late 2021), growing team to 3 full-time developers by 2022. Built Arabic language matching prototype for Middle East expansion and Google Sheets integration enabling sales team to score candidate-job pairs in real-time by auto-parsing spreadsheet data to internal matching API.

Berliner Hochschule für Technik

Student Research Assistant - Infrastructure

Summer 2019, Berlin

Tech Stack: Python, Bash, LAMP

- Provisioned bare-metal servers using automated Bash scripts
- Delivered part of the foundational compute infrastructure used to launch and support the university's new Data Science Master's program.

PrintPeter GmbH

Working Student Software Development (20h/week)

Oct 2017–Sep 2018, Berlin

Tech Stack: Python, Django, PostgreSQL, MySQL, SQLite, HTML, CSS

- Supported C-level, marketing and product teams with SQL queries, full-stack development and template automation.

Selected Projects

- Factory: REST API service for orchestrating GenAI tasks (Text, Image, Audio).
[philsupertramp/factory](#)
- Label-ling: Training recipes for producing production-grade NER models.
[philsupertramp/label-ling](#)
- Chain Smoker: Testing tool with a Go-based proxy to record and replay HTTP requests.
[philsupertramp/chain-smoker](#)

Teaching Experience

Summer 2023

Lecturer @ Berliner Hochschule für Technik

"Introduction to Machine Learning" for the Embedded Systems studies.
